principles of finance 201 final exam answers

Preparing for the Principles of Finance 201 final exam can be a daunting task, especially given the comprehensive scope of topics covered in the course. To excel, students need to understand core concepts, principles, and practical applications that underpin financial decision-making. This guide aims to provide a detailed overview of the key principles and potential exam answers, helping students navigate the exam with confidence. Whether you are reviewing fundamental theories or applying financial formulas, this resource offers structured insights to support your success.

Understanding the Fundamentals of Finance

What Is Finance?

Finance is the study of managing money, investments, and other financial instruments. It involves understanding how individuals, businesses, and organizations allocate resources over time, considering risk and return.

Core Principles of Finance

Finance is built upon several foundational principles, including:

- Time Value of Money (TVM)
- Risk and Return Tradeoff
- Financial Markets and Institutions
- Cost of Capital
- Capital Budgeting

These principles form the backbone of many exam questions and are critical for analyzing financial scenarios.

Key Topics Likely Covered in the Final Exam

Time Value of Money (TVM)

Understanding how money's value changes over time is essential.

Present and Future Value

- Present Value (PV): The current worth of a future sum of money, discounted at a specific rate.
- Future Value (FV): The amount an investment will grow to over a period at a given interest rate.

Formulas for TVM

- $FV = PV \times (1 + r)^n$
- $PV = FV / (1 + r)^n$

where:

- r = interest rate per period
- n = number of periods

Risk and Return

A core concept in finance involves balancing potential returns against associated risks.

Types of Risks

- Market Risk
- Credit Risk
- Operational Risk
- Liquidity Risk

Expected Return and Standard Deviation

- Expected Return: The weighted average of all possible returns.
- Standard Deviation: A measure of total risk or volatility.

Capital Asset Pricing Model (CAPM)

Provides a way to determine the expected return of an asset based on its risk relative to the market.

Expected Return = Risk-Free Rate + Beta $\times$ (Market Return - Risk-Free Rate)

where Beta measures an asset's sensitivity to market movements.

Financial Markets and Instruments

Understanding different markets and financial instruments is crucial for exam performance.

Primary and Secondary Markets

- Primary Market: Where new securities are issued.
- Secondary Market: Where existing securities are traded among investors.

Common Financial Instruments

- Stocks (Equities)
- Bonds (Debt Securities)
- Derivatives (Options, Futures)
- Mutual Funds and ETFs

Cost of Capital

The minimum return required by investors to finance a project.

Calculating Cost of Debt and Equity

- Cost of Debt = Yield to Maturity (YTM) on existing debt
- Cost of Equity = Using CAPM or Dividend Discount Model (DDM)

Weighted Average Cost of Capital (WACC)

Represents the average rate a company must pay to finance its assets.

$$WACC = (E/V) \times Re + (D/V) \times Rd \times (1 - Tc)$$

where:

- E = Market value of equity
- D = Market value of debt
- $V = E + D$
- R_e = Cost of equity
- R_d = Cost of debt
- T_c = Corporate tax rate

Applying Financial Principles to Real-World Problems

Capital Budgeting Techniques

Evaluating investments involves analyzing cash flows and using specific methods.

Net Present Value (NPV)

- NPV = Sum of Present Values of all cash inflows and outflows.
- Decision Rule: Accept projects with $NPV > 0$.

Internal Rate of Return (IRR)

- The discount rate that makes $NPV = 0$.
- Decision Rule: Accept projects where IRR exceeds hurdle rate.

Payback Period

- Time needed to recover initial investment.
- Useful for assessing liquidity but ignores the time value of money.

Financial Ratios and Their Significance

Ratios help analyze company performance and financial health.

Liquidity Ratios

- Current Ratio = $\text{Current Assets} / \text{Current Liabilities}$
- Quick Ratio = $(\text{Current Assets} - \text{Inventory}) / \text{Current Liabilities}$

Profitability Ratios

- Return on Assets (ROA) = Net Income / Total Assets
- Return on Equity (ROE) = Net Income / Shareholders' Equity

Leverage Ratios

- Debt-to-Equity Ratio = Total Debt / Shareholders' Equity

Exam Strategies for Principles of Finance 201

Understanding Question Types

Be prepared for:

- Multiple-choice questions testing definitions and formulas

Recognizing these themes helps in approaching exam questions systematically.

Analyzing Typical Final Exam Questions and Model Answers

To understand the principles behind effective answers, we analyze sample questions commonly encountered and illustrate comprehensive solutions.

Question 1: Calculating Present Value of an Investment

Question:

An investor expects to receive \$10,000 annually for 5 years. If the discount rate is 8%, what is the present value of this annuity?

Analysis:

This question tests knowledge of annuities and present value calculations.

Solution Approach:

Use the present value of an annuity formula:

$$PV = C \times [(1 - (1 + r)^{-n}) / r]$$

where:

- C = annual cash flow (\\$10,000)
- r = discount rate (8% or 0.08)
- n = number of periods (5)

Calculation:

$$PV = 10,000 \times [(1 - (1 + 0.08)^{-5}) / 0.08]$$

$$PV = 10,000 \times [(1 - (1.08)^{-5}) / 0.08]$$

$$PV = 10,000 \times [(1 - 0.68058) / 0.08]$$

$$PV = 10,000 \times (0.31942 / 0.08)$$

$$PV = 10,000 \times 3.99275 = \$39,927.50$$

Key Takeaway:

The answer demonstrates the importance of understanding the formula and accurately performing the calculations, including discount factor computations.

Question 2: Understanding Risk and Return

Question:

A stock has an expected return of 12%. The risk-free rate is 3%, and the expected market return is 8%. Using the CAPM, what is the stock's beta?

Analysis:

This question assesses knowledge of the CAPM formula:

$$\text{Expected Return} = \text{Risk-Free Rate} + \text{Beta} \times (\text{Market Return} - \text{Risk-Free Rate})$$

Rearranged to solve for beta:

$$\text{Beta} = (\text{Expected Return} - \text{Risk-Free Rate}) / (\text{Market Return} - \text{Risk-Free Rate})$$

Solution:

$$\text{Beta} = (0.12 - 0.03) / (0.08 - 0.03)$$

$$\text{Beta} = 0.09 / 0.05 = 1.8$$

Key Takeaway:

Accurate understanding of the CAPM formula and careful algebraic manipulation are critical for correct answers.

Question 3: Capital Budgeting Decision

Question:

A project requires an initial investment of \$100,000 and is expected to generate cash flows of \$30,000 annually for 5 years. The company's WACC is 10%. Should the project be accepted based on NPV?

Analysis:

Calculate NPV:

$$\text{NPV} = \text{Present Value of Cash Flows} - \text{Initial Investment}$$

PV of cash flows for an annuity:

$$\text{PV} = C \times [(1 - (1 + r)^{-n}) / r]$$

Plug in values:

$$PV = 30,000 \times [(1 - (1 + 0.10)^{-5}) / 0.10]$$

Calculate:

$$(1 + 0.10)^{-5} = 0.62092$$

$$PV = 30,000 \times [(1 - 0.62092) / 0.10]$$

$$PV = 30,000 \times (0.37908 / 0.10)$$

$$PV = 30,000 \times 3.7908 = \$113,724.00$$

$$NPV = \$113,724 - \$100,000 = \$13,724$$

Decision:

Since $NPV > 0$, the project should be accepted.

Key Takeaway:

Understanding cash flow discounting and NPV decision rules is essential for capital budgeting questions.
