What Is Solubility?

Definition of Solubility

Solubility refers to the maximum amount of a substance (solute) that can dissolve in a solvent at a specific temperature and pressure to form a saturated solution. It is typically expressed in units such as grams per liter (g/L), moles per liter (mol/L), or as a percentage.

Factors Affecting Solubility

Several factors influence how well a substance dissolves, including:

- Temperature
- Pressure (especially for gases)
- Nature of solute and solvent (polarity, molecular structure)
- Presence of other substances (common ions, competing solutes)

Types of Solubility Practice Problems

Solubility problems can vary widely in complexity, but they generally fall into these categories:

- Calculating Solubility from Data

Given experimental data, determine the solubility of a substance.

- Determining the Saturation of a Solution

Assess whether a solution is saturated, unsaturated, or supersaturated based on the amount of solute dissolved.

- Calculating the Mass or Moles of Solute Dissolved

Find out how much solute is dissolved in a given volume of solution.

- Using Solubility Product Constant (K_{sp})

Apply K_{sp} to determine the solubility of slightly soluble salts.

Solubility Practice Problems with Answer Key

Below are sample problems accompanied by detailed solutions to illustrate how to approach and solve typical solubility questions.

Problem 1: Calculating Solubility from Data

Question:

A solution contains 36 grams of NaCl dissolved in 1 liter of water at 25°C. Is this solution saturated, unsaturated, or supersaturated? The solubility of NaCl at 25°C is approximately 36 g/L.

Solution:

Since the solution contains 36 g of NaCl per liter, which matches the known solubility limit at 25°C, the solution is saturated.

Answer:

The solution is saturated at 25°C.

Problem 2: Determining if a Solution is Saturated

Question:

You have 50 grams of KNO_3 dissolved in 1 liter of water at 20°C . The solubility of KNO_3 at 20°C is 32 g/L. Is the solution saturated, unsaturated, or supersaturated?

Solution:

- Actual dissolved amount: 50 g
- Solubility limit: 32 g/L

Since $50\text{ g} > 32\text{ g}$, the solution contains more than the maximum dissolved at equilibrium, indicating it is supersaturated.

Answer:

The solution is supersaturated.

Problem 3: Calculating the Mass of Solute in a Saturated Solution

Question:

What is the maximum mass of AgCl that can be dissolved in 2 liters of water at 25°C ? The solubility of AgCl at 25°C is 0.89 g/L.

Solution:

- Solubility of AgCl : 0.89 g/L
- Volume of water: 2 L

Total maximum mass = solubility $\times$ volume = $0.89\text{ g/L} \times 2\text{ L} = 1.78\text{ g}$

Answer:

A maximum of 1.78 grams of AgCl can dissolve in 2 liters of water at 25°C .

Problem 4: Using K_{sp} to Find Solubility

Question:

Calculate the molar solubility of calcium fluoride (CaF_2), given that its K_{sp} at 25°C is 3.9×10^{-11} .

Solution:

The dissociation of CaF_2 :

Let the molar solubility be s mol/L.

$$- [\text{Ca}^{2+}] = s$$

$$- [\text{F}^-] = 2s$$

$$K_{sp} = [\text{Ca}^{2+}][\text{F}^-]^2 = s \times (2s)^2 = s \times 4s^2 = 4s^3$$

Set equal to K_{sp} :

$$4s^3 = 3.9 \times 10^{-11}$$

Solve for s :

$$s^3 = (3.9 \times 10^{-11}) / 4 = 9.75 \times 10^{-12}$$

$$s = (9.75 \times 10^{-12})^{(1/3)} \approx 2.15 \times 10^{-4} \text{ mol/L}$$

Answer:

The molar solubility of CaF_2 at 25°C is approximately 2.15×10^{-4} mol/L.

Strategies for Solving Solubility Problems

$$[\text{Ag}^+] = s$$

$$[\text{Cl}^-] = s$$

- Write the Ksp expression:

$$K_{sp} = [\text{Ag}^+][\text{Cl}^-] = s \cdot s = s^2$$

- Solve for s :

$$s = \sqrt{K_{sp}} = \sqrt{(1.77 \times 10^{-10})} = 1.33 \times 10^{-5} \text{ mol/L}$$

Answer:

The solubility of AgCl is approximately 1.33×10^{-5} mol/L.

Answer Key Notes:

2. Predicting Precipitate Formation

Problem Example:

Will a precipitate form when 0.0100 mol of BaCl_2 is added to 1.00 L of a solution containing 0.0010 mol of sulfate ions (SO_4^{2-})? K_{sp} of BaSO_4 is 1.1×10^{-10} .

Solution Steps:

- Calculate the initial concentrations:

$$[\text{Ba}^{2+}] = 0.0100 \text{ mol} / 1 \text{ L} = 0.0100 \text{ M}$$

$$[\text{SO}_4^{2-}] = 0.0010 \text{ mol} / 1 \text{ L} = 0.0010 \text{ M}$$

- Determine the ionic product:

$$[\text{Ba}^{2+}][\text{SO}_4^{2-}] = (0.0100)(0.0010) = 1.0 \times 10^{-5}$$

- Compare with K_{sp} :

Since $1.0 \times 10^{-5} \gg 1.1 \times 10^{-10}$, the ionic product exceeds K_{sp}

- Conclusion:

Precipitate will form because the ionic product exceeds the solubility product.

Answer:

Yes, BaSO_4 will precipitate under these conditions.

QuestionAnswer What is a solubility temperature graph? A solubility temperature graph is a plot that shows the relationship between the temperature of a solvent and the maximum amount of solute that can be dissolved at that temperature. How does temperature affect solubility according to these graphs? Typically, the solubility of most solids increases with temperature, resulting in an upward-sloping graph, while gases generally have decreased solubility with increasing temperature.

What information can be obtained from a solubility temperature graph? It helps determine the solubility of a substance at different temperatures, predict how much solute can be dissolved at a given temperature, and understand how temperature changes affect solubility. Why do some substances show a steep increase in solubility with temperature? How can solubility temperature graphs be used in industrial processes? They assist in designing processes like crystallization, crystallization control, and purification by optimizing temperature conditions to maximize solute recovery. What is the significance of the saturation point on a solubility temperature graph? The saturation point indicates the maximum amount of solute that can dissolve at a specific temperature, beyond which excess solute remains undissolved. Can solubility temperature graphs be used for gases? If so, how? Yes, but unlike solids, gases typically become less soluble as temperature increases. The graph will usually show a decrease in solubility with higher temperatures. What are some common methods to create a solubility temperature graph? Solubility data is collected experimentally at various temperatures, then plotted with temperature on the x-axis and solubility on the y-axis to generate the graph. How does the concept of supersaturation relate to solubility temperature graphs? Supersaturation occurs when the solution contains more solute than the equilibrium solubility at a given temperature, which can be visualized as the solution being above the solubility curve on the graph.
