Detailed Explanation of Key Concepts with Examples

Universal Law of Gravitation

Newton's law states that every point mass attracts every other point mass in the universe with a force directly proportional to the product of their masses and inversely proportional to the square of the distance between them.

Mathematical expression:

$$F = G \frac{m_1 m_2}{r^2}$$

Where:

- F = gravitational force
- G = universal gravitational constant ($6.674 \times 10^{-11} \text{ Nm}^2\text{kg}^{-2}$)
- m_1, m_2 = masses of the objects
- r = distance between the centers of the two masses

Example:

Calculate the gravitational force between two objects with masses of 10 kg and 20 kg separated by a distance of 5 meters.

Solution:

[

$$F = 6.674 \times 10^{-11} \times \frac{10 \times 20}{5^2} = 6.674 \times 10^{-11} \times \frac{200}{25} = 6.674 \times 10^{-11} \times 8 = 5.339 \times 10^{-10} \text{ N}$$

]

This example demonstrates how to apply the formula and interpret the physical significance.

Acceleration Due to Gravity (g)

At the Earth's surface, the acceleration due to gravity is approximately $(9.8, \mathrm{m/s^2})$, but it varies with altitude and depth.

Variation with altitude:

[

$$g' = g \left(\frac{R}{R + h} \right)^2$$

]

Where:

- (g') = acceleration due to gravity at height (h)
- (R) = Earth's radius (~ 6371 km)
- (h) = height above Earth's surface

Variation with depth:

[

$$g' = g \left(1 - \frac{h}{R} \right)$$

]

for shallow depths.

Example:

Calculate g at a height of 100 km above Earth's surface.

Solution:

[

$$g' = 9.8 \times \left(\frac{6371}{6371 + 100} \right)^2 \approx 9.8 \times \left(\frac{6371}{6471} \right)^2 \approx 9.8 \times (0.983)^2 \approx 9.8 \times 0.966 \approx 9.48, \mathrm{m/s^2}$$

]

This shows a slight decrease in gravity with altitude.

Kepler's Laws and Their Derivations

Kepler's laws describe planetary motions:

- First Law: Planets orbit the Sun in elliptical paths with the Sun at one focus.
- Second Law: A line segment joining a planet and the Sun sweeps out equal areas during equal intervals.
- Third Law: The square of the orbital period (T) of a planet is proportional to the cube of the semi-major axis (r):

[

$$T^2 \propto r^3$$

]

Application:

Using the third law, students can compare the orbital periods of different planets based on their distances from the Sun.

Gravitational Potential Energy and Escape Velocity

- Gravitational Potential Energy (GPE):

[

$$U = -G \frac{m_1 m_2}{r}$$

]

- Escape Velocity:

[

$$v_{\text{escape}} = \sqrt{2 G \frac{M}{R}}$$

\]

Where:

- (M) = mass of the Earth or other celestial body
- (R) = radius of the celestial body

Example:

Calculate the escape velocity from Earth.

Solution:

\[

$$v_{\text{escape}} = \sqrt{2 \times 6.674 \times 10^{-11} \times \frac{5.972 \times 10^{24}}{6.371 \times 10^6}} \approx 11.2, \text{ km/s}$$

\]

This is the minimum speed needed to leave Earth's gravitational influence without further propulsion.
